Collaboration through the whole lifecycle involves an increasing amount of partners

Collaboration through the whole lifecycle involves an increasing amount of partners

The next evolution stage brings new technological demands within but also new governance and business patterns

one-to-one
bilateral data exchange

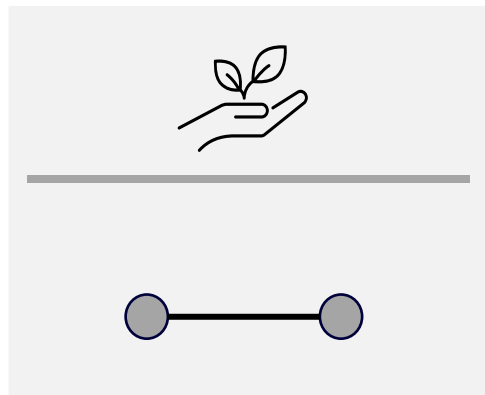

few-to-few
closed community data sharing

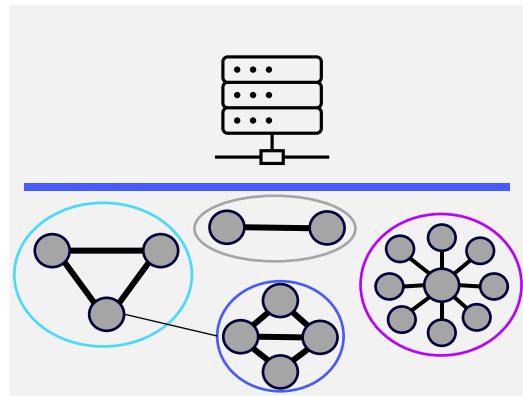

many-to-many
decentralized and dynamic
data ecosystem

New approaches are needed to reach the next evolution stage

The next evolution stage brings new technological demands within but also new governance and business patterns

one-to-one
bilateral data exchange

few-to-few
closed community data sharing

Dataspaces enable ecosystems

- **No long-term integration artefacts** for every single business relationship
- Dynamical, flexible, and **demand-driven** data consumption and integration
- **Trust and control mechanisms** for data sharing are required

many-to-many
decentralized and dynamic
data ecosystem

Important Data Issues in Business Ecosystems

Trust and Security

Data Sovereignty

Interoperability

Reliability & Global Reach

Standards | Trust Mechanisms | Technologies | Global Initiatives

Business

- Business collaboration format
- Multilateral organization for a data sharing purpose
- Shared goals of participants regarding the exchange and sharing of data
- Decision making body for collective data governance

Dataspaces

Technology

Legal

- Instrument for the implementation of the European and member states' data strategies
- Potential object of application of EU Data Governance Act
- Object of application of European values for data sharing and data sovereignty

General Design Principles¹

- No physical data integration, leave data where it is (→ **federated data architecture**)
- No common schema required (→ integration foremost on **semantic level through vocabularies**)
- Data networking, data visiting and data co-existence
- Nesting and overlaps possible (→ **ecosystem of data spaces**)

Additional IDS² Design Principles

- Data sovereignty and traceability
- Trusted participants

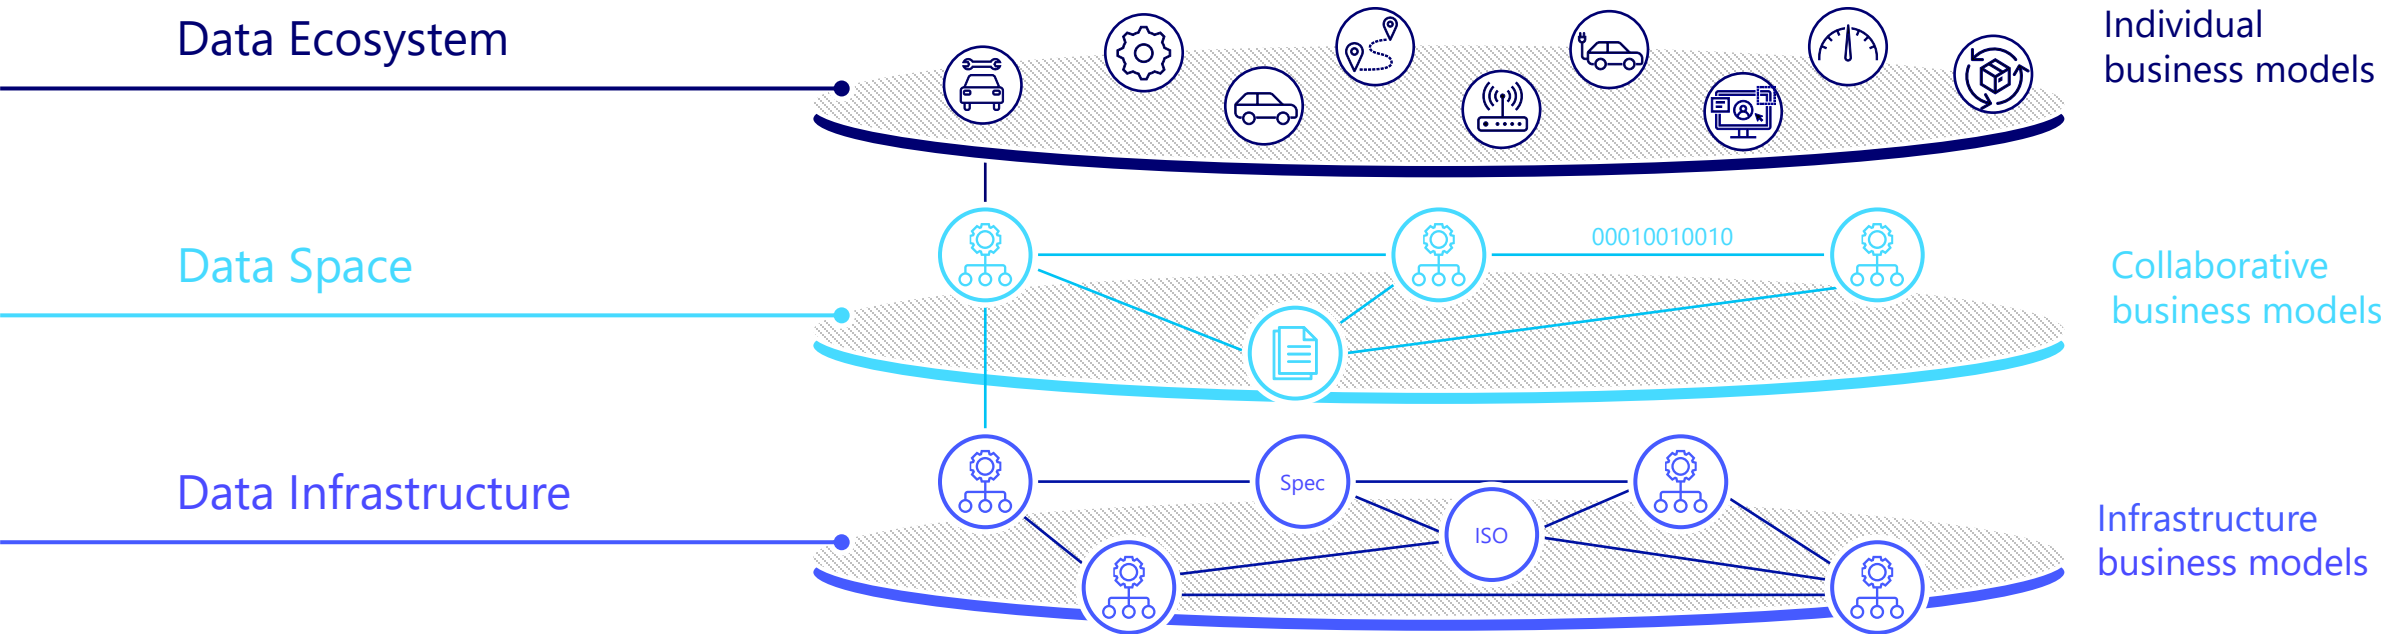

- Data remains at the data holder and is only shared when needed
- Data sharing based on metadata, individual agreements, and policies
- Extension to services for logging or auditability

Use Cases @ automotive customers?

Collaborative Engineering – Demands & Challenges

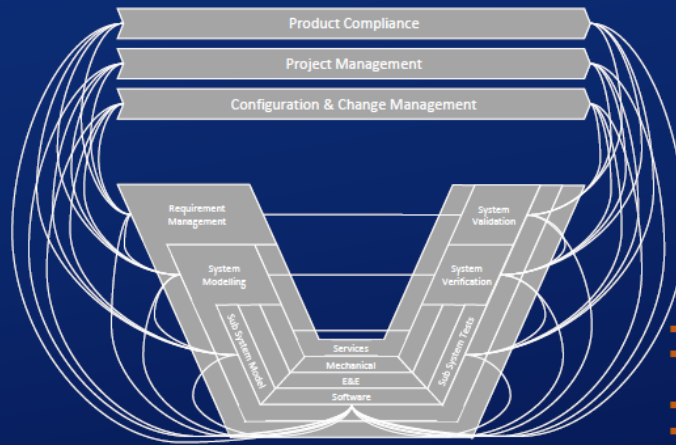

PLM

Product Ideation, Requirements, Engineering & Design

Production Planning & Production

Product Performance & Disposal

E2E Lifecycle Management requires E2E linking & traceability of models & data!

Business Graph Based Operational Analytics:

- Traceability & Transparency
- Semantic Search
 - Impact, Root Cause, Coverage Analysis
 - 360° View & Exploration
 - Digital Twin: Generic, Unique, Operational

Advanced Data & Process Analytics:

- Diagnostic, Descriptive, Predictive, Prescriptive
- Data Exploration
 - Business Intelligence
 - Data Science
 - Reasoning

Software DevOps, IT Strategy & Management

- DevOps, Data Access, FAIR Data, Integration
- Data Engineering
 - App DevOps
 - E2E Ecosystem
 - Enterprise Architecture

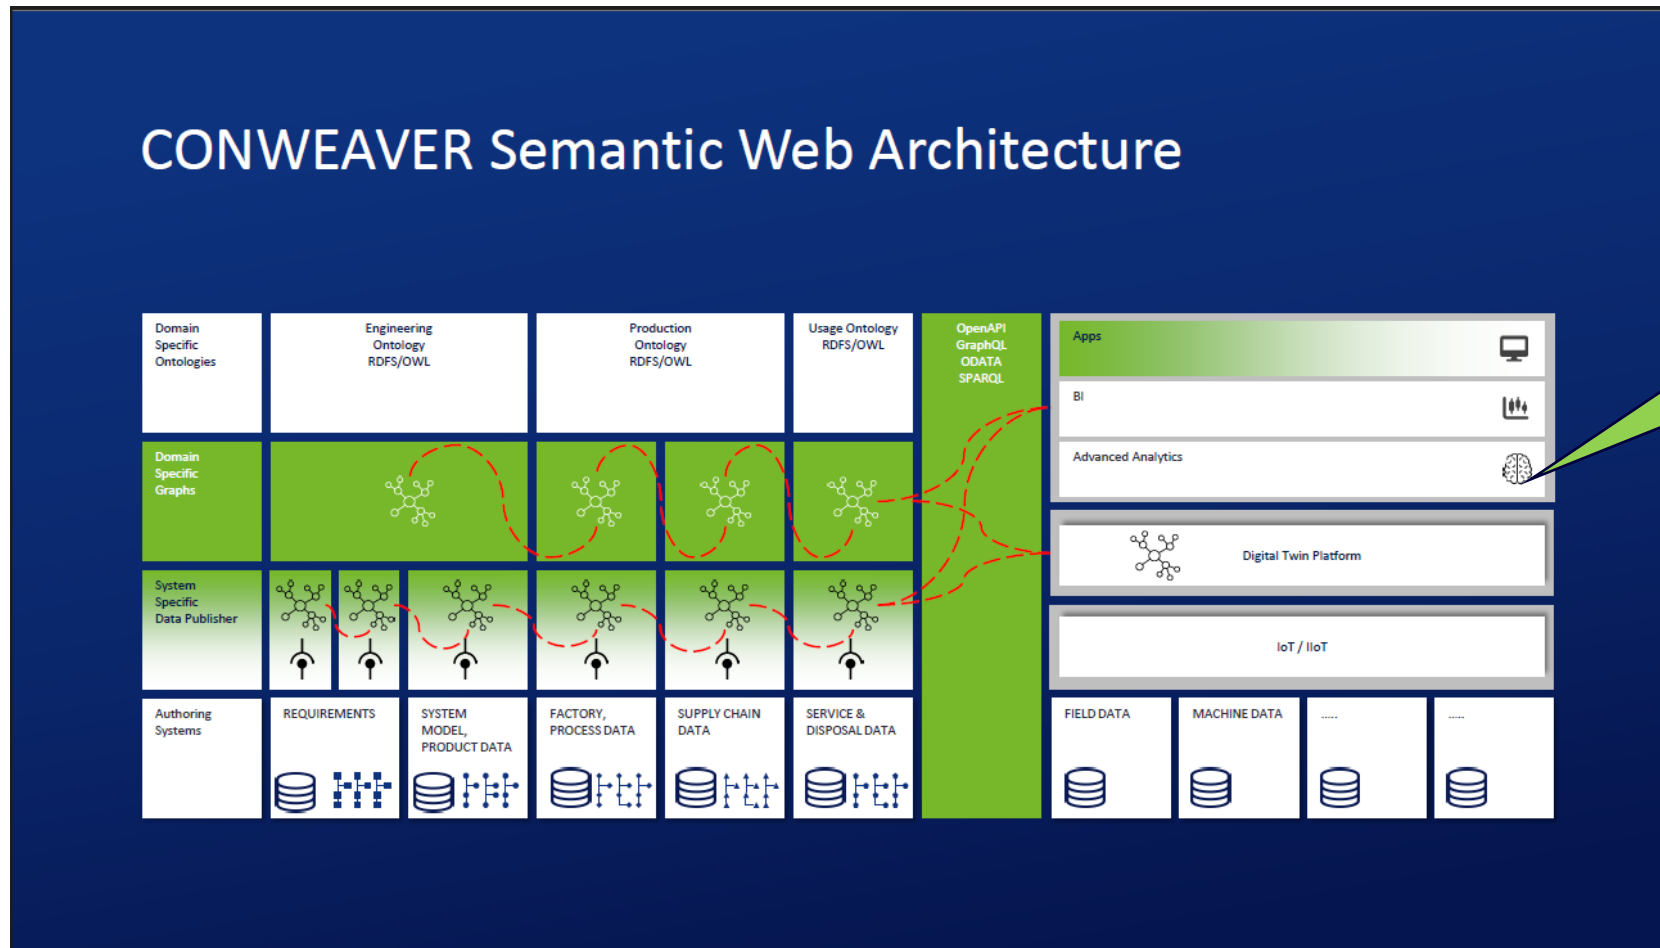

Data Lifecycle Management

- Data Security, Compliance, Harmonization
- Data Stewardship, Data Governance
 - Data Provisioning, Data Layer
 - Enterprise Architecture
 - E2E Ecosystem

- Manifold of IT systems to connect
- Integration into existing infrastructure & dev. Workflows (DevOps)
- Short development time in weeks
- Scalability
- High-performance querying
- Integration of up-to-date data into apps, analyzes and queries
- Cloud native
- Accessibility via open standards for e. g. AI

Disconnected enterprise data silos are one of the biggest obstacles!

Solution Concept of CONWEAVER Semantic Web Architecture

How to use EKG for AI?
